## 1 Brief description of the Calibration system

Three devices are used for HEMT receiver calibration. They have 2 positions, and can be moved in/out the beam under CAN control:

- A hot load, moved with a rotary jack.
- A cold load, moved with a translation table.
- A mirror (MH5), also moved with a rotary jack.

The hot load is moved with a rotary solenoid.

The translation table and the mirror are actuated through pneumatic motors driven by 24V DC electrovanes.

All (end) positions are detected with 24 Volt proximity limit switches.

### 1.1 HEMT-INFO Rack

This rack was developed for calibration control using a CAN Bus. It includes:

**a)** 5 linear power supplies necessary to drive:

-CAN Bus power (+24V) for all devices on the CAN bus.

-“Pneumatics power” (+24V) for all electrovanes.

--+6V Logic, +6V Motors, -6V Motors required by all CAN backshort motors inside the LO Rack.

These 6V power supplies were originally 5 Volt models, modified in order to increase the output voltage. Their current limitation resistor also had to be modified (0.22 Ohm instead of 0.39) in order to reach the nominal current of 1.5 Ampere @ 6 Volt. Their overvoltage protection (crowbar + thyristor) was suppressed.

**N.B:** Normally, no current from the motors' supply should flow in the “0V Motor” conductor.

**b)** A CAN-HEMT module, composed of 1 CANIO board and 1 interface board for electrovanes and limit switches. The 2 boards are enclosed in a RFI-proof box.

All connections to/from the HEMT-INFO rack are located on the front-panel.

The mains switch and the mains fuse are also located on the front-panel.

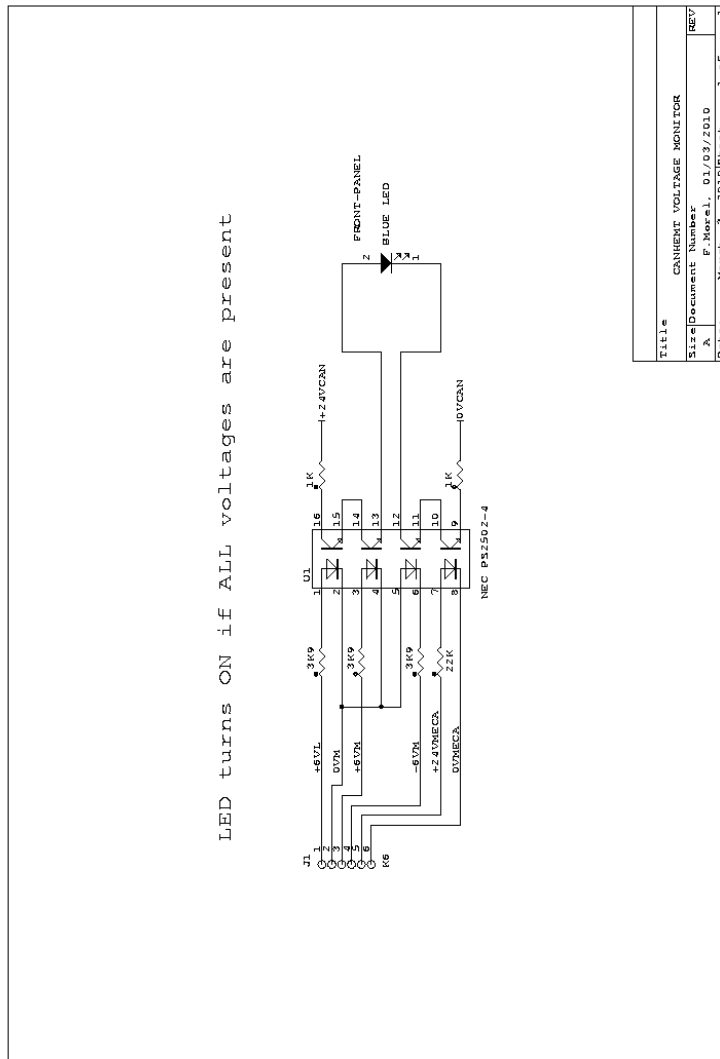

1.2 HEMT-INFO Rack block-diagram

## 2 Hardware

### 2.1 Power check

A front-panel blue LED turns on ONLY if **ALL** supply voltages are present, thanks to a small voltage monitor located inside the rack.

## 2.2 Left side Panel

There are 3 connectors on the (fixed) most-left part of the front-panel.  
From top to bottom:

**-CAN connector 1 (Sub-D 9 MALE)** conforms to IRAM standard. This connector is also the power supply source for all CAN devices on the CAN Bus.

<b>1</b>	Shield and PE
<b>2</b>	CAN Low
<b>3</b>	CAN GND
<b>4</b>	unused
<b>5</b>	CAN + 24V Power Supply
<b>6</b>	unused
<b>7</b>	CAN High
<b>8</b>	unused
<b>9</b>	CAN 0V Power Supply

**-CAN connector 2 (Sub-D 9 FEMALE):** This is the **ONLY** female connector used for CAN Bus. It is used to connect the 3 lines of CAN Bus to the CAN master (CAN Board inside server PC)

<b>1</b>	No Connection
<b>2</b>	CAN Low
<b>3</b>	CAN GND
<b>4</b>	No Connection
<b>5</b>	No Connection
<b>6</b>	No Connection
<b>7</b>	CAN High
<b>8</b>	No Connection
<b>9</b>	No Connection

**-CAN Motors Power connector (Sub-D 9 Female)** carries the power supplies of all CAN Motors.

<b>1</b>	No Connection
<b>2</b>	+6VL
<b>3</b>	+6VM
<b>4</b>	0VM
<b>5</b>	-6VM
<b>6</b>	No Connection
<b>7</b>	No Connection
<b>8</b>	No Connection
<b>9</b>	No Connection

## 2.3 HEMT module

This module can be extracted from the rack and has no backplane connections. It needs 2 power supplies isolated from each other:

-The CAN +24V, fed from CAN Bus.

-The “pneumatics” +24V, fed from a plastic Lemo connector (located on the rear side of the module) and an extensible cable.

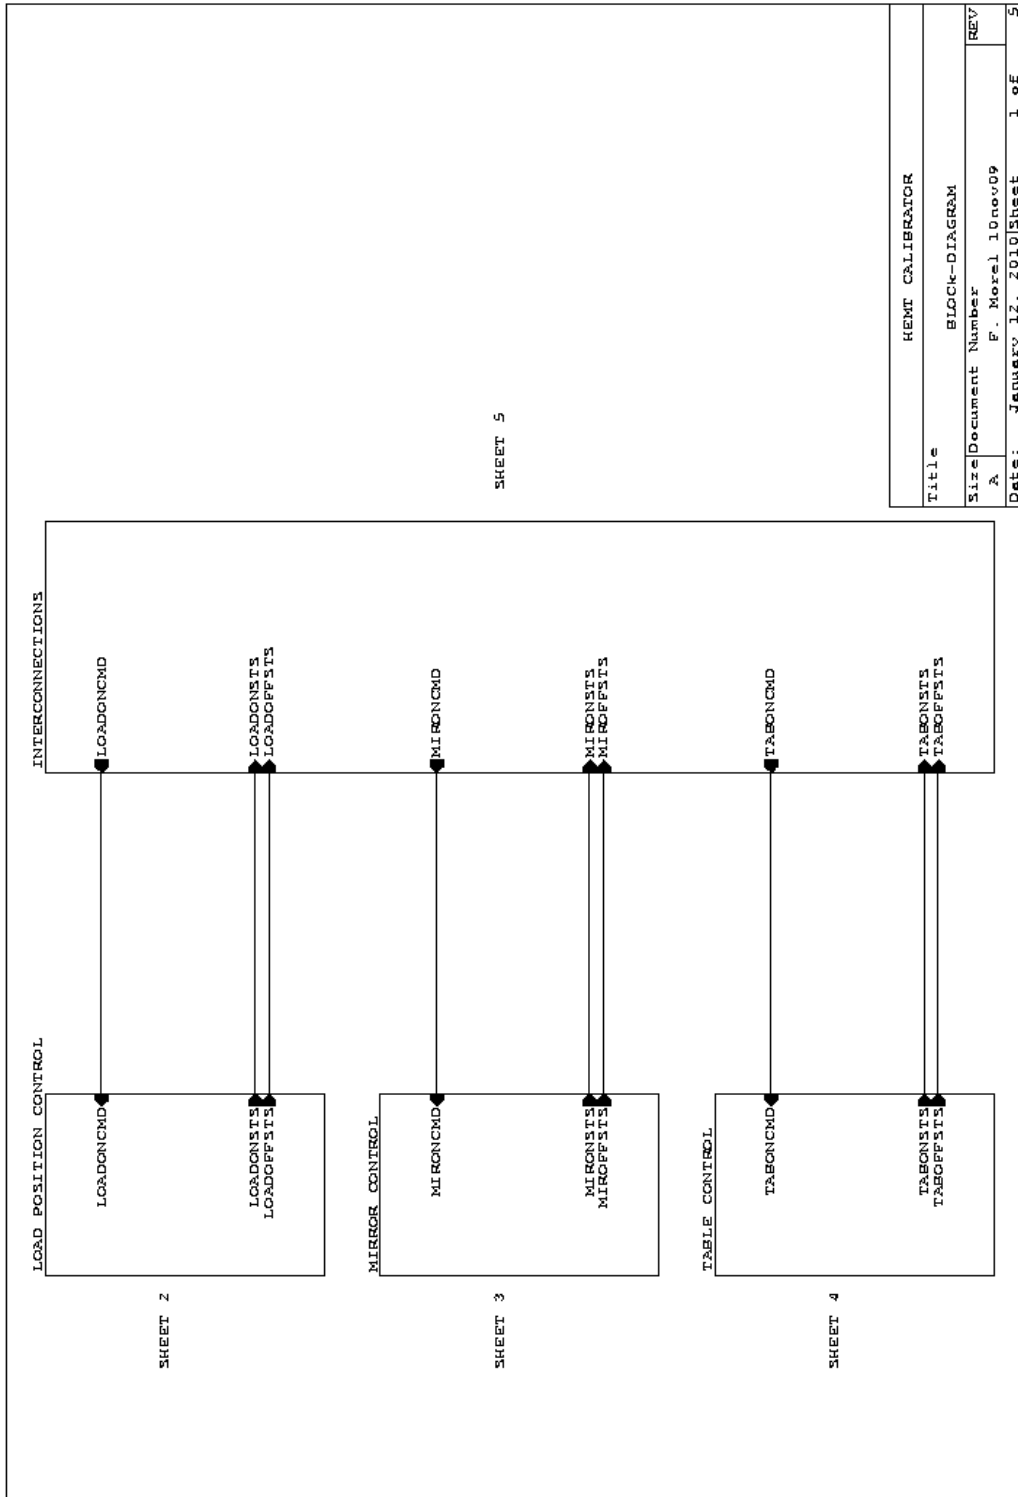

**2 boards** are installed inside the HEMT module box: A CANIO Board and an Interface Board. Both boards are galvanically isolated from each other. The 2 boards are interconnected (inside the module box) through a 64-pos flat cable and opto-couplers.

**The 0V of the “pneumatics” power supply is connected to the box housing, and thus to Earth.**

### 2.3.1 CANIO Board

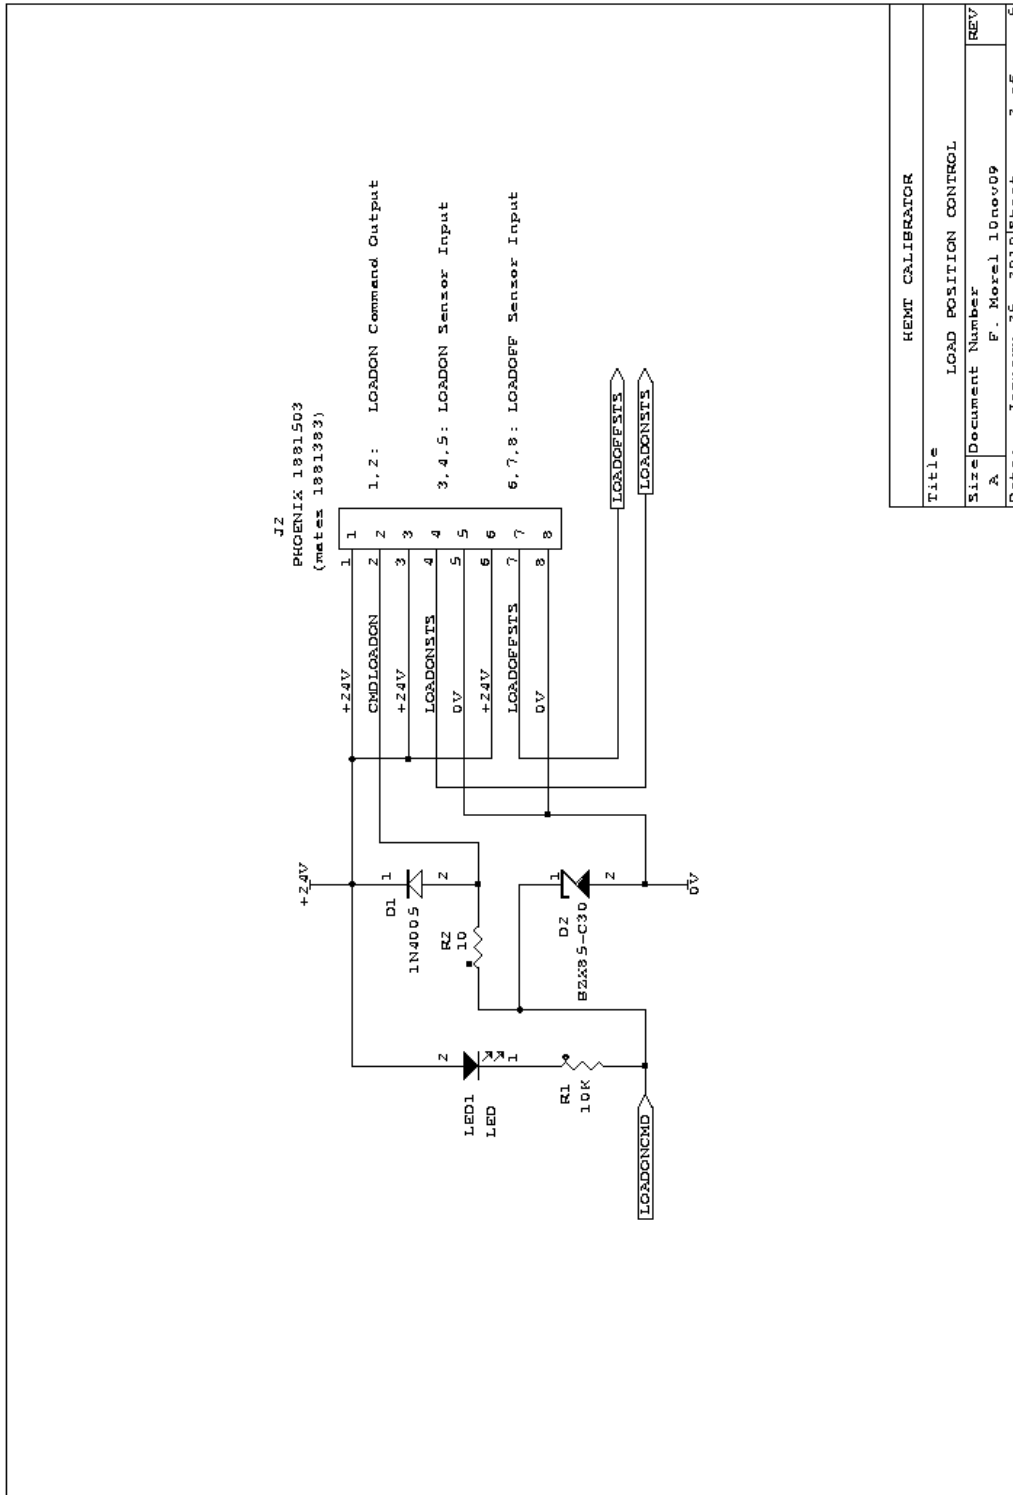

See doc of the CANIO board in [~/computer/doc/can/canIO/canIO.pdf](#).

### 2.3.2 Interface Board schematics

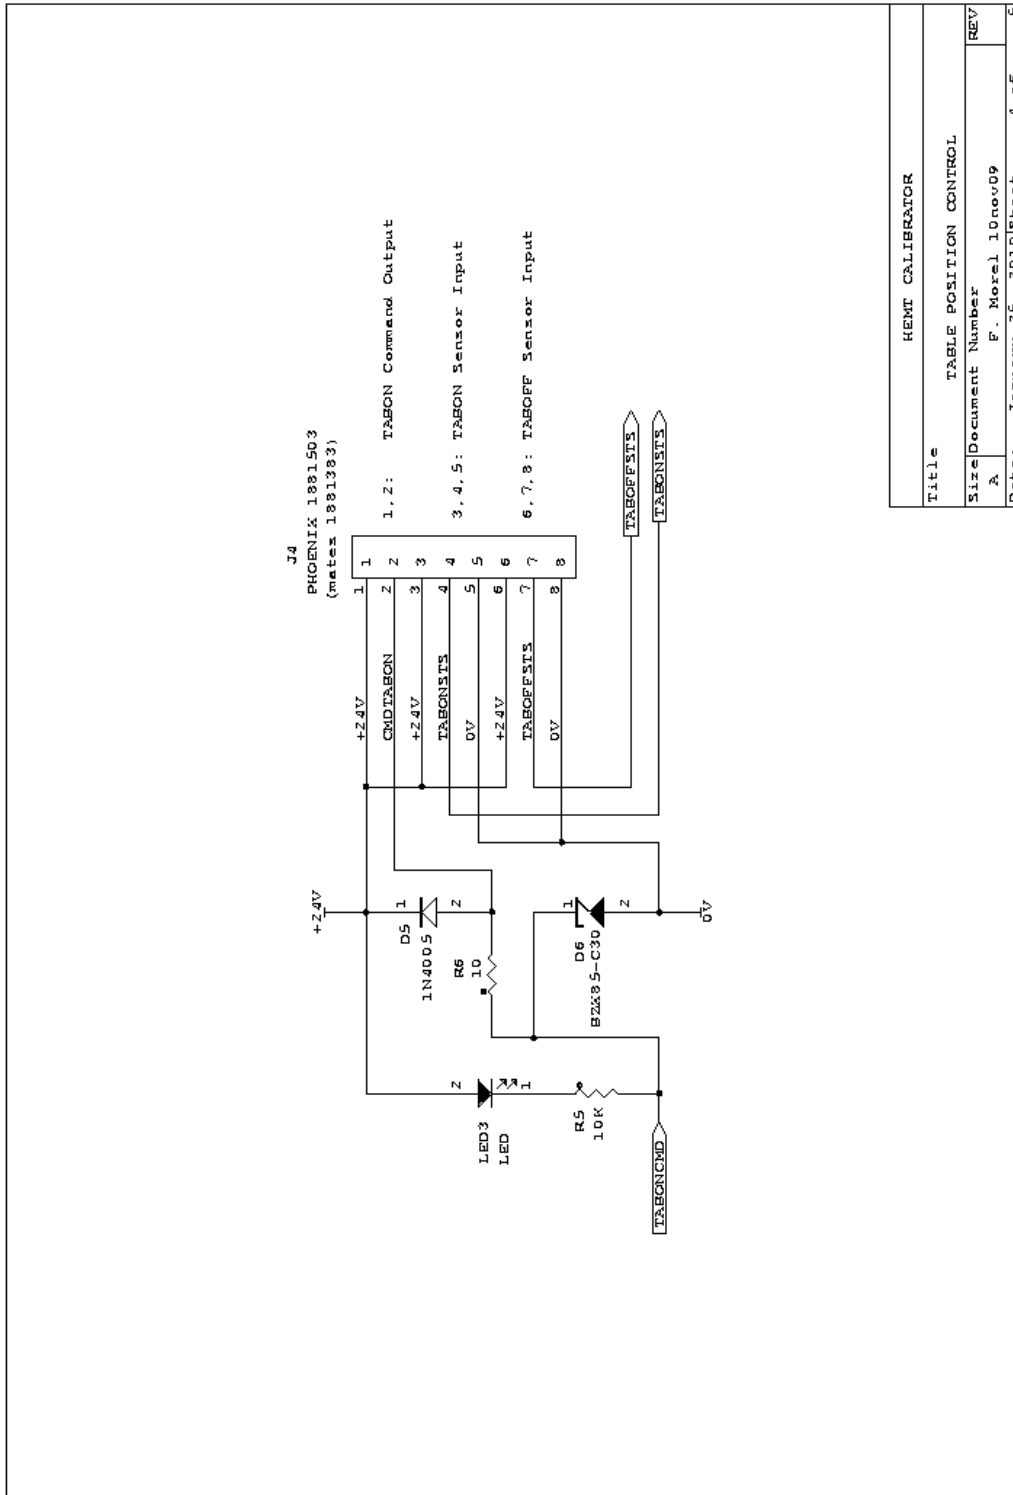

Title		HEMT CALIBRATOR	
Size		BLOCK-DIAGRAM	
Document Number	A	F. Morel 10nov09	REV
Date:		January 12, 2010	Sheet 1 of 5

### 2.3.3 HEMT Module front-panel CAN Connectors

Both CAN connectors are internally connected pin-to-pin for daisy-chain purpose. Their pinout conforms to IRAM standard:

1	Shield and PE (optional)
2	CAN Low
3	CAN GND
4	unused
5	CAN + 24V Power Supply
6	unused
7	CAN High
8	unused
9	CAN 0V Power Supply

### 2.3.4 HEMT Module front-panel Calibration devices Connectors

The three connectors are similar:

-Command outputs are current-limited, and were designed to drive 24V/250mA (6 Watt) loads.

But they can drive 60V/3A if the interface board limitation resistor is removed.

-Status inputs will accept any voltage from +/- 5 Volt to +/- 24 Volt.

**N.B: The 0V of the “pneumatics” power supply is connected to Earth.**

HOT LOAD Connector:

Pin 1 (TOP)	Set Load ON+ Output	+24V
Pin 2	Set Load ON- Output	OFF = +24V, ON = 0V
Pin 3	+24V	Sensor power supply
Pin 4	Load ON Input	Sensor LOAD ON output
Pin 5	0V	Sensor GND
Pin 6	+24V	Sensor power supply
Pin 7	Load OFF Input	Sensor LOAD OFF output
Pin 8 (BOTTOM)	0V	Sensor GND

MIRROR Connector:

Pin 1 (TOP)	Set Mirror ON+ Output	+24V
Pin 2	Set Mirror ON- Output	OFF = +24V, ON = 0V
Pin 3	+24V	Sensor power supply
Pin 4	Mirror ON Input	Sensor MIRROR ON output
Pin 5	0V	Sensor GND
Pin 6	+24V	Sensor power supply
Pin 7	Mirror OFF Input	Sensor MIRROR OFF output
Pin 8 (BOTTOM)	0V	Sensor GND

TABLE Connector:

Pin 1 (TOP)	Set TABLE ON+ Output	+24V
Pin 2	Set TABLE ON- Output	OFF = +24V, ON = 0V
Pin 3	+24V	Sensor power supply
Pin 4	TABLE ON Input	Sensor TABLE ON output
Pin 5	0V	Sensor GND
Pin 6	+24V	Sensor power supply
Pin 7	TABLE OFF Input	Sensor TABLE OFF output
Pin 8 (BOTTOM)	0V	Sensor GND

### 3 Low-level software Interface

#### 3.1 Commands

16 command bits are available as outputs from the CANIO board. 3 bits (selectable through a wrapping zone on the interface board) are used to drive the hot load, the mirror and the table.

Upon startup or after reset, all command outputs are OFF.

**Commands are writable at CAN-ID 0x01 0C 01 10**

	<b>1</b>	<b>0</b>
<b>Bit[2]</b>	Set Table On	Set Table Off
<b>Bit[1]</b>	Set Mirror On	Set Mirror Off
<b>Bit[0]</b>	Set Load On	Set Load Off

#### 3.2 Status

16 status bits are available as inputs to the CANIO board. 6 bits (selectable through a wrapping zone on the interface board) are used to read the limit switches.

**Status are readable at CAN-ID 0x01 0C 01 00**

	<b>11</b>	<b>10</b>	<b>01 (reset default)</b>	<b>00</b>
<b>Bits[5-4]</b>	Impossible	Table is ON	Table is OFF	Table is moving
<b>Bits[3-2]</b>	Impossible	Mirror is ON	Mirror is OFF	Mirror is moving
<b>Bits[1-0]</b>	Impossible	Load is ON	Load is OFF	Load is moving
